Orig Pub: Glasnik biol. sek. Hrvatsko prirodosl. drustvo, 1953
(1955). Ser. 29, 7, 326-328.

Abstract: In the fruit tree nurseries of Uzh, Pozhezi, Krag-
uevtse, Mladenovtse, Zhebarim and Chachke (Yugo-
slavia), a method is utilized of raising young fruit
transplants without shields. This significantly
increased the quality and reduced the costs of plan-
ting material. The experiments were conducted on a
great number of stocks and varieties of fruit trees.

Title : Soil Treatment and Utilization at the Planting
of the Plum Tree, Especially the Soil
Damaged by Erosion

Orig Pub : Pol'oprivreda, 1957, 5, No 1, 26-31

Abstract : In Yugoslavia, the soil, on the whole, is
suitable for the growing of plums, but
their yield is low and periodic. To a
considerable extent, this is caused by the
fact that the soil under the plum trees is
not attended to. A higher level of agricul-
tural engineering is recommended. In the

ORG: MTI

TITLE: Preparation and properties of fibers from acrylonitrile¹ diketene
copolymer¹

SOURCE: Khimicheskiye volokna, no. 6, 1965, 13-16

TOPIC TAGS: synthetic fiber, acrylonitrile, copolymerization, chemical reaction, tensile strength, rupture strength, elongation

ABSTRACT: Fibers were formed by the wet method from solutions of acrylonitrile-diketene copolymers in dimethylformamide. Copolymers of 40,000-45,000 molecular weight and containing 4-6 mol % diketene on the weight of the copolymer gave most stable solutions from which fibers having 7-8% elongation were formed. Different types of reactive groups were introduced by treating the fibers with hydroxylamine or hexamethylenediamine (HMDA). Introduction of amine or hydroxylamine¹ groups enabled the fibers to be dyed with acid dyes¹. Chemically dyed fibers were obtained by reacting the copolymer fibers with HMDA and dyes containing amino groups. Subsequent treatment of acrylonitrile-diketene copolymer fibers with HMDA significantly increased the zero-
